

Roles and Responsibilities

1. **USER REGISTRATION & AUTHENTICATION Example:** Sarah, an employee experiencing a software login issue, visits the organizational Online Complaint Portal. She logs in securely using her corporate email and password. Upon successful JWT authentication, she is routed directly to a clean, personalized user dashboard.
2. **BROWSING CATEGORIES & TICKET CLASSIFICATION Example:** Sarah browses the available internal departments—such as IT, HR, Maintenance, and Finance. She categorizes her issue by selecting **IT Department** → **Software Access**, and tags the ticket with a "High" priority level to ensure proper routing.
3. **LOGGING A COMPLAINT Example:** She clicks “Create Ticket,” fills out a detailed description of the error code, and attaches a screenshot (validated safely under the 5MB file limit). Once submitted, the ticket enters the database as "Pending," and the visual status stepper on her dashboard updates immediately to reflect the successful submission.
4. **ASSIGNMENT & COMPLAINT CONFIRMATION Example:** The system's smart assignment logic (or a supervising Admin) routes the ticket to David, a specialized IT Support Agent, based on his current workload and the IT category. Sarah's visual tracking stepper updates to reflect that the ticket has been officially assigned.
5. **USER COMPLAINT MANAGEMENT & COMMUNICATION Example:** Sarah tracks the real-time progression of her ticket via her dashboard. While waiting, she uses the in-ticket direct messaging thread to send David an additional error log she just found, keeping all communication perfectly centralized to that specific complaint.
6. **ADMIN OVERSIGHT (BACKGROUND PROCESS) Example:** An Admin in the executive control center monitors the backend ecosystem. They enforce Role-Based Access Control (RBAC), ensuring only authorized personnel have "Agent" privileges, while actively monitoring system analytics to prevent queue bottlenecks in the IT department.
7. **PLATFORM GOVERNANCE & ESCALATION Example:** The Admin oversees overall SLA compliance across all departments. If Sarah's ticket remains unresolved past a standard timeframe, the Admin flags it as **isEscalated**, prioritizing it in David's queue and generating a data footprint for the monthly CSV/PDF compliance export.

8. **AGENT'S DASHBOARD & TASK MANAGEMENT Example:** David logs into his dedicated Agent Dashboard, filtering his assigned queue to focus on active high-priority IT tickets. He opens Sarah's ticket, transitions the status to "In Progress," and adds an official, timestamped remark to the immutable audit trail stating that he is currently debugging the server.
9. **RESOLUTION & POST-TICKET FEEDBACK Example:** David deploys the fix, updates the ticket status to "Resolved," and logs his final resolution notes in the audit trail. Sarah verifies the software is working and is immediately prompted by the system to submit a satisfaction survey, leaving a 5-star rating and a brief comment praising the quick turnaround.
